Planning (Project Plan)

Project Identification

Project Name:

Insurance Claim Submission & Tracking System

Current Problem:

- 1 Lost or misplaced paper-based claim forms leading to severe processing delays.
- 2 Lack of real-time tracking for policyholders regarding their claim status.
- 3 High risk of human error, manual calculation mistakes, and fraudulent or duplicate claims.

4 Difficulty in archiving, managing, and reviewing medical and physical damage documentation efficiently.

Description about project:

- 1 Allows policyholders to submit insurance claims online and attach required documentation easily.
- 2 Provides real-time tracking for claim status (e.g., Pending, Under Review, Approved, Rejected).
- 3 Assists insurance adjusters in validating documents and processing claims faster.
- 4 Enhances security and prevents fraud through role-based access control and validation rules.
- 5 Maintains a centralized database for auditing, financial settlements, and historical records.

System Request

System Request—Insurance Claim Submission & Tracking System

Project Sponsor:

Insurance Company Board / System Administrator

Business Need:	1 Reduce claim processing time from weeks to days. 2 Eliminate manual paper-based claim handling. 3 Enhance customer satisfaction through status transparency.
Business Requirements:	1. Customer portal for claim submission and live status tracking. 2. Adjuster dashboard for document review and claim evaluation. 3. Integration with payment gateway for compensation payout. 4. Automated notification unit (Email/SMS updates)
Business Value:	1. Save operational time, effort, and customer support costs. 2. Fraud reduction and prevention of duplicate claims. 3. Improved data accuracy and automated record management.
Special Issues or Constraints:	1. Strict compliance with financial and medical data privacy standards. 2. System deployment deadline: January 1st

Feasibility Analysis

Technical Feasibility

- 1 Designing the user interface using HTML, CSS, JavaScript, or modern frameworks (e.g., React/Angular).

-
- 2 Using Visual Studio / VS Code as the core development environment.
 - 3 Developing a robust database management system using SQL/PostgreSQL for secure data storage.
 - 4 Ensuring full system responsiveness across different operating systems (Windows, Android, iOS)

Economic Feasibility

- 1 High Return on Investment (ROI) by significantly cutting down operational and paper costs.
- 2 Expected losses are minimal and restricted to initial infrastructure setup costs.
- 3 Reduces financial loss caused by fraudulent, duplicate, or unverified claims.
- 4 Development and hosting costs are reasonable and recoverable within a short operating period

Organizational Feasibility

- 1 **Management Prowess:** Evaluating the management team's capability to transition employees from traditional paper workflows to a digital tracking system.
 - 2 **Resource Sufficiency:** Evaluating non-financial resources such as human capital (developers, QA testers), server infrastructure, cloud security, and intellectual property protection.
-
